

Agile Project Management

Today organizations are scrambling to become lean and agile for meeting changing customer needs and expectations, and for efficiently producing high-quality products, services, and solutions. The need to be agile and cost-effective has been intensified further by growing global competition, continuous innovation in technology, and by incredibly short time-to-market requirements. Like any change, the transition to agile is hard and requires not only organizational and personal commitment but also people with knowledge and experience in agile methodologies

The job market has registered very strong demand for professionals trained in agile techniques indicating that organizations are becoming serious in agile adoption. Although recent recognition of agile techniques in improving project performance has been based in software development, the methodologies have been successfully applied to a number of domains including media development, high-technology, and information technology, etc. In this course we will look at agile tools and techniques for effectively and efficiently undertaking knowledge-based projects of today.
